### *Introduction to 30/30*

*Hello. Are you interested in learning about how to reduce our carbon footprint right away? Join us for 30 minutes to learn about renewable fuels, the kind that are used in planes, trains, automobiles and more.*

*I'm Joanne Ivancic, executive director of Advanced Biofuels USA, a nonprofit educational organization. Our 30/30 sessions will provide you with 30 minutes of a recorded presentation about topics related to renewable fuels. The free package also includes a copy of the text of the presentation, along with links to references and a 30-minute discussion guide. I want to thank LanzaTech for funding that makes these 30/30 sessions possible.*

## Advanced Biofuels USA

**Advocates** for the adoption of advanced biofuels as an

- energy security,
- military flexibility,
- economic development
- climate change mitigation
- pollution control

# solution.

[www.AdvancedBiofuelsUSA.org](http://www.AdvancedBiofuelsUSA.org)

Frederick, MD

2

*And to thank the Advanced Biofuels USA team for creating and presenting 30/30.*

*So, let's get started with the first in the series, an Introduction to Renewable Fuels: What, How and Why.*

### **Background/Resources**

Our key tool for accomplishing this is our web site, [www.AdvancedBiofuelsUSA.org](http://www.AdvancedBiofuelsUSA.org), a resource for everyone from opinion-leaders, decision-makers and legislators to industry professionals, investors, feedstock growers and researchers; as well as journalists, teachers and students.

In addition, we prepare technology assessments, present briefing documents to Congressional staff, participate in international conferences on renewable fuels, provide both background and attributed interviews for a wide range of journalists and broadcast reporters, consult with international conference organizers, conduct presentations and lectures for civic and school groups, and provide general assistance to those interested in any facet of the world of advanced biofuels.

*To begin:*

**What do you think of when you hear  
“bioenergy”? Or “renewable energy”?**

**Does it include energy for transportation?**

Copyright 2020 Advanced Biofuels USA

3

*Before we get into details, I have a question.*

*What do you think of when you hear the word “bioenergy? Or renewable energy?”*

*Do you think about energy for transportation? For cooking? For heating?*

*We are going to talk about all of these during the next half hour.*

## What do you think of when you hear “*biofuel*”?

- Corn-based Ethanol?
- Biodiesel from used cooking oil, canola/rapeseed?
- Ethanol from sugar cane, cassava, sugar beets?
- Renewable jet fuel?

Copyright 2020 Advanced Biofuels USA

4

*What do you think of when you hear the word “biofuel”?*

*Many people in the US will answer corn ethanol because in the US about 10% of the gasoline is ethanol molecules that are made from corn.*

*In the EU, people might say biodiesel or renewable diesel and think of used cooking oil, canola or rapeseed used to make it.*

*In Africa, Asia and Brazil, you might say ethanol from sugar cane or from cassava.*

*Or maybe you think of renewable jet fuel.*

# Sustainable, Renewable Fuels Advanced Biofuels

**What are they?**  
**What are they used for?**  
*Yesterday, Today, Tomorrow*  
**How are they made?**  
**Why are they important?**  
**Sustainability?**  
**Policy Considerations?**  
*Jobs/Careers Throughout*

Copyright 2020 Advanced Biofuels USA

5

*This is what we are going to talk about in this session. We'll go through this pretty quickly. You can always come back to the slides to look at the details later.*

*At the end of the presentation, you should be able to answer these questions and discuss these topics. At least a little bit.*

Future sessions will delve into more details.

# Sustainable, Renewable Fuels Advanced Biofuels

## What are they?

What are they used for?

*Yesterday, Today, Tomorrow*

How are they made?

Why are they important?

Sustainability

Policy Considerations

*Jobs/Careers throughout*

Copyright 2020 Advanced Biofuels USA

6

*First, What are advanced renewable fuels?*

# What Advanced Biofuels Are Used for Transportation?

Ethanol is **a** biofuel, not the only biofuel.

Biodiesel

Renewable Diesel

Sustainable Aviation Fuel (SAF)

Bio-isobutanol

Renewable Natural Gas

rDME

Drop-in Hydrocarbons

Maritime/Marine Fuels

Copyright 2020 Advanced Biofuels USA

**ULTRA-LOW SULFUR  
HIGHWAY DIESEL FUEL**  
(15 ppm Sulfur Maximum)

Required for use in all highway diesel vehicles and engines.  
Recommended for use in all diesel vehicles and engines.

**UP TO 5% BIODIESEL**

#6416

*Many people have heard of ethanol used as a fuel as we talked about earlier. Ethanol is not the only fuel that can be made from renewables. These others are, too.*

## “First Generation” Biofuel

**Corn-based ethanol, sugarcane ethanol**  
(nearly 200 proof moonshine or 100% ethanol)

One of the **few currently commercially available** biofuels you can buy for vehicles today. Blends of 10%, 15%, 85%

Replaces MTBE, provides octane.

- And the ethanol molecule is part of many other things

- Wine
- Beer
- Whiskey

Copyright 2020 Advanced Biofuels USA

8

*But let's start with ethanol.*

*Many people don't realize that the ethanol that we talk about with regard to fuel is the same molecule as the ethanol or alcohol in wine, beer, whiskey. Corn ethanol has long been nick-named "moonshine."*

### Background/References:

Important note: Ethanol for use as a transportation fuel must be highly distilled, basically 200 proof or nearly 100% ethanol. As soon as the ethanol is distilled and ready for transport from a biorefinery, some gasoline is added to "poison" it so that it will not be drinkable, and will not be diverted to beverage purposes (denatured ethanol).

**Fuel ethanol:** Ethanol intended for fuel use. Fuel ethanol in the United States must be anhydrous (less than 1 percent water). Fuel ethanol is denatured (made unfit for human consumption), usually prior to transport from the ethanol production facility, by adding 2 to 5 volume percent petroleum, typically pentanes plus or conventional motor gasoline. Fuel ethanol is used principally for blending in low concentrations with motor gasoline as an oxygenate or octane enhancer. In high concentrations, it is used to fuel alternative-fuel vehicles specially designed for its use. See

Alternative-Fuel Vehicle, Denaturant, E85, Ethanol, Fuel Ethanol Minus Denaturant, and Oxygenates.

**Fuel Ethanol Minus Denaturant:** An unobserved quantity of anhydrous, biomass-derived, undenatured ethanol for fuel use. The quantity is obtained by subtracting the estimated denaturant volume from fuel ethanol volume. Fuel ethanol minus denaturant is counted as renewable energy, while denaturant is counted as nonrenewable fuel. See Denaturant, Ethanol, Fuel Ethanol, Nonrenewable Fuels, and Oxygenates .

Photos are an old crusher and presser which might be used for grapes (similar ones for apples and other fruit); and the distillery at Mount Vernon, VA, a re-creation of the distillery operated by George Washington on his plantation.

If you want to add a history lesson, or integrate this with lessons in the history department, you can talk about how corn was converted to liquid (moonshine whiskey) to both increase its value and make it easier to move large volumes across the Appalachian mountains in the early days of the United States. The Whiskey Rebellion is a related topic.

Note the parallels in the problems that people have today moving large volumes of raw biomass to biorefineries to those of the European settlers who lived west of the mountains; their markets to the East.

# Renewable Fuel “Generations”

## Primary Biofuel

### Feedstock:

Firewood, wood chips, pellets, dung, forest and crop residues, tallow, landfill gas, bees wax, vegetable oil

### Process:

Combustion

### Product:

Heat, light, power

## 1st Generation

### Feedstock:

Crops that can also be used for food—corn, wheat, barley, sugarcane, sugar beet, vegetable oil ...

### Conversion Process:

Fermentation of starch and sugars, transesterification of oils

### Product:

Ethanol, biodiesel, biobutanol, ...

## 2nd Generation “Cellulosic”

### Feedstock:

Agricultural and forest waste and residues, used cooking oil, industrial waste, municipal solid waste, grasses, non-edible oil seed crops, food processing waste, food waste, plants that can be grown on marginal land, ...

### Conversion Process:

Same as 1st generation and many more to convert not only starches, simple sugar and oil; also other parts of the plants

## 3rd Generation

### Feedstock:

Algae and other aquatic organisms that don't require crop land; microalgae, macroalgae (seaweed), cyanobacteria, lemna/duckweed, ...

### Conversion Process:

Same as 2nd generation

## 4th Generation

### Feedstock:

Water, air, carbon dioxide, waste industrial gases, non-recyclable plastics, municipal solid waste ...

### Conversion Process:

electrolysis, photosynthesis, fermentation, catalysis

### Products:

solar fuels, e-fuels such as hydrogen, methanol, and ammonia when renewable energy powers the conversion; plus those listed below.

**Products:** Ethanol, biodiesel, “drop-in” substitutes for jetfuel, diesel, gasoline, rocket fuel, heating fuel, maritime fuel—all liquid fuels. Sometimes two conversion processes are required to get to final products. The first conversion to the “building blocks” of fuels, chemicals and other products.

Copyright 2020 Advanced Biofuels USA

10

*You will hear people talk about 1st generation and 2nd generation biofuels. Generally, the higher the generation, the more sustainable the fuel was thought to be; although we will see that it's a lot more complicated than that. This gives you some idea about the factors considered when using generational descriptions.*

## Background/Resources:

This is a very inexact system of description and less relevant as renewable fuels develop; but still often used.

2nd generation biofuels

3rd generation biofuels

4th generation fuels

See also Generations 1, 2, 3 and 4: Talking about biofuels

<https://advancedbiofuelsusa.info/biofuels-basics/biofuels-basics/#gen>

“Next Generation” refers to anything past the 1st Generation. For example in the “Next Generation Fuels Act” introduced in the US Congress by Rep. Cheri Bustos (D-IL

17) <https://advancedbiofuelsusa.info/bustos-introduces-next-generation-fuels-act/>

# Sustainable, Renewable Fuels Advanced Biofuels

**What are they used for?**

*Yesterday, Today, Tomorrow*

**How are they made?**

**Why are they important?**

**Sustainability**

**Policy Considerations**

*Jobs/Careers throughout*

Copyright 2020 Advanced Biofuels USA

10

*Now we know, generally, what advanced renewable fuels are. What are they used for?*

# What Are Renewable Fuels Used For? Yesterday: Early Automobiles

Ford Model T (spark-ignition engine fueled with corn ethanol)

The Citroën Rosalie (diesel engine with peanut oil -1893)

With Spark Advance to Change Fuels – Flex Fuel

**Biodiesel History**

**Rudolf Diesel**

- Ran with peanut oil
- Optimistic about biofuels for future
- 1<sup>st</sup> Diesel Engine, 1893
- Alterations because of low petroleum prices

"The use of vegetable oils for engine fuels may seem insignificant today but such oils may become, in the course of time, as important as petroleum and coal-tar products at the present time." (Rudolf Diesel, 1920)

Copyright 2020 Advanced Biofuels USA

13

*Think about it. In the early days of cars and trucks, there wasn't a system of gas stations or fueling stations. People used horses, oxen, mules and other animals for transportation and work. So cars and trucks were built to use the fuel that could be made on farms or near where the cars and trucks were used. Thus, the original Ford Model T ran on ethanol and the first diesel engines used peanut oil.*

*When gasoline came into use, later Model Ts were the first "flex-fuel" vehicles. They could use ethanol and gasoline. And, eventually, gasoline was sold mixed with ethanol, as we do today.*

## Background/Resources

[cleanfuelforthought.wordpress.com](http://cleanfuelforthought.wordpress.com)

[http://en.wikipedia.org/wiki/Citro%C3%ABn\\_Rosalie](http://en.wikipedia.org/wiki/Citro%C3%ABn_Rosalie)

[http://www.fuel-testers.com/ethanol\\_fuel\\_history.html](http://www.fuel-testers.com/ethanol_fuel_history.html)

<http://advancedbiofuelsusa.info/up-with-octane-and-down-with-aromatics-continuing-health-risks-with-petroleum-fuels-and-the-need-for-engine-efficiency/> good history

The Ford Model T was designed to run on corn ethanol.

In 1933, Citroën introduced the Rosalie, the first commercially available passenger car with a diesel engine developed with Harry Ricardo. <https://en.wikipedia.org/wiki/Citro%C3%ABn>

Inspired by Sadi Carnot's writings to create a more efficient engine, he began working on his project in 1885, and eventually secured financial support from Maschinenfabrik Augsburg (forerunner of Maschinenfabrik Augsburg-Nürnberg and the present-day MAN Diesel) and Friedrich Krupp AG (now ThyssenKrupp). He received a patent for his heat-driven oil engine, now called the diesel engine, in 1892,

and powered up the first working diesel engine — fueled by peanut oil — on 10 August 1893. After working out some problems with the design, he introduced a 25-horsepower, four-stroke, single cylinder compression engine in 1897, which gained widespread use after being displayed in the Munich Exhibition of 1898.

The diesel engine is an internal-combustion, compression-ignition mechanism which works by heating fuels (either petroleum-based or bio-derived) and causing the fuel to ignite. Driven solely by high compression in its cylinders, the diesel engine is generally more energy-efficient, quieter, and needs less maintenance and repairs than other internal combustion engines. As Diesel himself wrote, "It is the diesel's higher compression ratio that leads to its greater fuel efficiency. Because the air is compressed, the combustion temperature is higher, and the gases will expand more after combustion, applying more pressure to the piston and crankshaft".

Yes, Tin Lizzie Was an Alcoholic

<https://advancedbiofuelsusa.info/yes-tin-lizzie-was-an-alcoholic/>

# What Are Renewable Fuels Used For? Today

- Fueling Cars and Trucks
  - Replace MTBE
  - High Octane
  - Ultra Low Sulfur Diesel

Copyright 2020 Advanced Biofuels USA

15

Today, you buy biofuels at the “gas” or “petrol” station. In the US, almost all the regular gasoline is E10—or 10% ethanol, a biofuel; some is 15%, E15. You might also see 20% and 30% ethanol blends. The more ethanol in the fuel, the higher the octane.

Ethanol use increased as a replacement for MTBE, an animal carcinogen that leaked into groundwater from gas station tanks. After many lawsuits, it was banned in about half the US states. However, it is still used in gasoline in other parts of the world and could be replaced with safer ethanol.

## Background/References:

Octane <https://advancedbiofuelsusa.info/tag/octane/>

Better performance from ethanol means higher compression ratios, lower heat of vaporization, higher torque.

## MTBE Bans Boost Ethanol

[https://www.pewtrusts.org/en/research-and-analysis/blogs/stateline/2005/06/06/mtbe-bans-boost-ethanol#:~:text=Of%20those%2019%20states%2C%20California,still%](https://www.pewtrusts.org/en/research-and-analysis/blogs/stateline/2005/06/06/mtbe-bans-boost-ethanol#:~:text=Of%20those%2019%20states%2C%20California,still%20)

20using%20gasoline%20with%20MTBE

MTBE in Gasoline: Clean Air and Drinking Water Issues

<https://www.everycrsreport.com/reports/RL32787.html>

You can also buy biodiesel blends. In the US often 2-5% of petroleum diesel is biodiesel; and some *fleets* use 20% or even 100% biodiesel, in public works equipment and farm equipment or in specially adapted cars and trucks.

So, you do use biofuels today, even if you don't know it.

## What Are Renewable Fuels Used For? Today

- Green Racing: E85 in Indy Cars

- NASCAR

- Green Racing: Le Mans series used to use E85; now E20

- Formula 1

Copyright 2020 Advanced Biofuels USA

18

*Ethanol does have less energy density, therefore E85 has up to 25% lower mileage per gallon than E10, BUT, it has better performance. Indy Cars use 85% ethanol. Cars racing in the old ALMS (American Le Mans Series) used a variety of renewable fuels experimenting with biobutanol, cellulosic E85, E10 and E20. NASCAR uses E15. Now cars racing IMSA to participate in the Le Mans Series use E20. Formula 1 plans to increase biofuel use from 10% to 100%.*

### Background/References:

Green Racing: <https://advancedbiofuelsusa.info/category/green-racing/>

America's sports car racing series embraces being green again

<https://arstechnica.com/cars/2019/06/americas-sports-car-racing-series-embraces-being-green-again/>

F1 already uses biofuels, but the current technical regulations say that fuel must include 5.75% of bio-components. In 2021, Symonds says that F1 is "looking to increase to 10%" with a view to get to 100% advanced sustainable fuels.

Two years after this rule was brought in by the FIA, this was also made a law for commercial fuels in Europe. The FIA regulations state that the fuels used in a Formula 1 car must be similar to what can be purchased at the pump for a road car.

# What Are Renewable Fuels Used For? Today

- **Fueling Aircraft**

Copyright 2020 Advanced Biofuels USA

20

*Renewable aviation fuel is called “Sustainable Aviation Fuel” or SAF. Globally, more than 40 airlines are already using SAF at some level, with about 200,000 commercial flights using SAF since 2011.*

**Background/References:** And 1.6 billion gallons of SAF committed to forward purchase agreements. Put another way, sustainable aviation fuel is already here. It’s powering aircraft with much less greenhouse gas emissions - up to 80 percent less carbon dioxide equivalent on a lifecycle basis compared to conventional jet fuel. SAF also emits less pollution, which contributes to cleaner air in communities located near airports.

<https://www.aviationpros.com/gse/fueling-equipment-accessories/fuel-distributors-suppliers-manufacturers/article/21144761/neste-north-america-now-is-the-time-to-let-sustainable-aviation-fuel-take-off>

<https://advancedbiofuelsusa.info/category/aviation/>

## **Virgin Atlantic Takes Flight with First Waste-to-Fuel Mix**

<http://www.cleantechconcepts.com/2018/10/virgin-atlantic-takes-flight-with-first-waste-to-fuel-mix/>

**Virgin Atlantic** flight VS16, from Orlando to Gatwick using a Boeing 747, ushered in a new era for low-carbon aviation that has been years in the making. Through a combination of chemistry, biotechnology, engineering and catalysis, the two

organizations (plus Virgin Atlantic and Boeing) have shown the world that carbon can be recycled and used for commercial flight. Passengers on the historic flight were welcomed by a familiar face on arrival as the airline's founder **Sir Richard Branson marshalled the aircraft into the gate (see video)**. This flight follows hot on the heels of a £410K UK government **Future Fuels for Flight and Freight** grant to determine the feasibility of building a 40-50M US gallon jet fuel plant in Britain.

LanzaTech, a Chicago based company, produces next-generation 'advanced' fuels by recycling waste industrial gases like those produced from steel making and other heavy industrial processes. LanzaTech takes these waste, carbon-rich gases to first make ethanol. The ethanol can be used for a range of low-carbon products, including jet fuel.

Today Virgin Atlantic is calling on the UK government to commit to making this fuel a commercial reality in the UK. Allowing access for new carbon capture and utilisation technologies like LanzaTech's to incentives already given to earlier generations of 'biofuels' and providing critical investor support will enable first plants to be swiftly built.

ADVANCING SUSTAINABLE AVIATION FUEL

[HTTPS://WWW.WSP.COM/EN-US/INSIGHTS/ADVANCING-SUSTAINABLE-AVIATION-FUEL](https://www.wsp.com/en-us/insights/advancing-sustainable-aviation-fuel)

<https://advancedbiofuelsusa.info/tag/commercial-flights/>

<https://advancedbiofuelsusa.info/tag/commercial-flights/>

For example, United Airlines flights between Los Angeles and San Francisco use a biofuel blend. Some Nordic countries are mandating renewable jetfuel use.

<https://advancedbiofuelsusa.info/proposal-for-sweden-to-follow-norways-lead-and-mandate-use-of-sustainable-aviation-fuels-from-2021/>

# What Are Renewable Fuels Used For? Today Fueling Buses with Renewable Natural Gas (RNG)

Table 2-29: Annual well-to-wheels GHG emissions for selected types of road vehicles (low WTT greenhouse gas emissions scenario)

Vehicle type	Annual well-to-wheels CO <sub>2</sub> e emissions (tonnes per year)			Percentage change in GHG emissions	
	Petrol/diesel	Natural gas	Biomethane	Natural gas vs petrol/diesel	Biomethane vs petrol/diesel
Passenger car (petrol)	1.70	1.39	0.20	-18%	-88%
Passenger car (diesel)	1.31	1.39	0.20	+6%	-85%
LCV	3.98	4.28	0.82	+8%	-79%
Small rigid truck	18.07	20.43	4.91	+13%	-73%
Large rigid truck 26 t	48.21	55.94	10.61	+16%	-78%
Articulated truck (>32 t)	135.38	136.23	82.00	+1%	-39%
Bus	57.53	60.96	10.10	+6%	-82%
Coach	46.14	53.12	9.60	+15%	-79%

Note: for passenger cars, the baseline comparator vehicle is petrol powered; for all other vehicles, the baseline comparator vehicle is diesel powered.

Well-to-wheel comparison of CO<sub>2</sub> emissions / Source: The role of natural gas and biomethane in the transport sector

<https://euinmyregion.blogactiv.eu/2016/07/04/biogas-buses-are-the-green-solution-for-cities/>

15

*Some buses around the world use renewable natural gas or biomethane for fuel in engines that can use compressed natural gas. This chart compares the greenhouse gas emissions among different fuels. You can see the greenhouse gas emissions benefit over petroleum diesel that you get RNG.*

# What Are Renewable fuels Used For?

## Today Flex Fuel Vehicles

If you have a flex fuel vehicle (FFV), you can use gasoline with blends up to 85% ethanol.

Look for the logo, check your owner's manual or look at the info on the driver's side door.

If you have a diesel engine, you might see a decal that indicates it was built to use up to 20% biodiesel, B20

17

*If you have a flex fuel vehicle, you can use gasoline with up to 85% renewable fuel--ethanol.*

*In the US, you can use E15 or 15% ethanol fuel in vehicles built since 2001. At this time motorcycles may only use up to 10% ethanol fuel, E10, the most common fuel at gas stations in the US. Thailand plans to make E20 a standard fuel.*

*Much diesel fuel in the US is 5% renewable biodiesel. Some diesel engine manufacturers build for 20% biodiesel use (B20). Some countries are looking at 30 and 40%.*

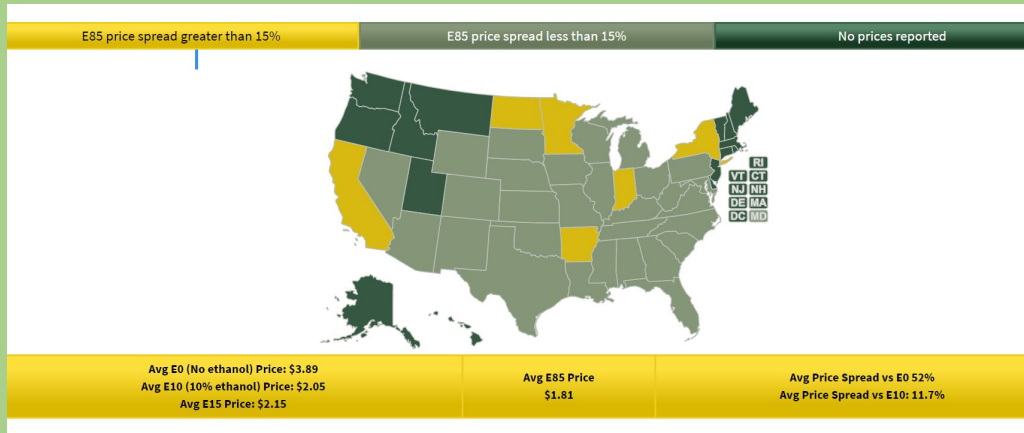

### **Background/References:**

to find out if you have a flex fuel vehicle or FFV, look for a logo on the car, check the owner's manual or look at the information on the drivers' door.

# What Are Renewable Fuels Used For? Today

Where can you buy renewable fuels? What do they cost?

Interactive map with E85 and E15 stations listed on this crowd-sourced database ([www.E85prices.com](http://www.E85prices.com)) Prices listed are examples from October 28, 2020

## What Are Renewable Fuels Used For? Today?

- Maritime/Marine Fuels

Copyright 2020 Advanced Biofuels USA

19

*In January 2020, the international maritime organization's regulation to reduce dangerous sulfur oxide emissions from ships went into effect. Low sulfur renewable fuels help the shipping industry meet these requirements.*

### **Background/References:**

The new upper limit on sulphur content on ships fuel oil is .50%, causing a 77% drop in overall SOx emissions from ships. This regulation will also lead to a decrease in particulate matter and prevent ocean acidification. Some other benefits to this regulation include reduction of stroke, asthma, cardiovascular disease, and benefit aquatic species and forests.

<https://www.imo.org/en/MediaCentre/PressBriefings/Pages/34-IMO-2020-sulphur-limit.aspx#:~:text=%E2%80%8BFrom%201%20January%202020,the%20limit%20is%20already%200.10%25>

*Military aircraft and ships around the world can use renewable fuels.*

### **Background/References:**

On March 25, 2010, the Air Force successfully conducted the first flight test of an aircraft powered by a 50-50 camelina-based biofuel blend. As of mid-2011, 99 percent of the Air Force fleet has been certified to fly on biofuel blends.<sup>15</sup> The Air Force expects to complete all flight testing by February 2012 and all certifications by December 2012.

The Navy also is actively engaged in testing and certifying advanced biofuels for planes and ships—flying the “Green Hornet” on a camelina-based jet fuel and floating Riverine Command Boat-Experimental (RCB-X) on a biofuel derived from algae.<sup>16</sup>

The Navy is planning to demonstrate a carrier strike group powered solely by alternative fuels in 2012. Dubbed the Great Green Fleet, the ships and planes are expected to conduct an extended mission in 2016, and all energy provided to operational platforms is to be 50 percent alternative by 2020.

# What Are Renewable Fuels Used For? Today or Tomorrow?

29

*Multi-country military exercises have proved that renewable fuels can be used interchangeably with other military spec fossil fuels*

## **Background/References:**

**2014** marks the first time the U.S. Navy is including biofuels in its annual procurement for bulk fuels.

More details can be found at <https://www.fbo.gov>, solicitation number SP060014R0061. READ MORE and MORE (Biofuels Digest; includes 10 backgrounders on the Navy’s biofuels’s program )

Washington, the Department of Defense has awarded \$210 million under the Defense Production Act to Emerald Biofuels, Fulcrum BioEnergy and Red Rock Bio towards the construction of biorefineries that produce cost-competitive, drop-in military biofuels. Under the grants, the companies will build biorefineries to produce military spec fuel that is expected to cost the US military, on a weighted average, less than \$3.50 per gallon

— or cost competitive with petroleum-based fuels, with availability expected as soon as 2016, and have a 50 percent of greater reduction of emissions compared to conventional fuels.

The biorefineries, once complete, will have a combined capacity for producing 100 million gallons of military-spec jet fuel and marine diesel. [READ MORE](#) and [MORE](#) (US Department of Energy)

These aspirations were effectively put on hold between 2017-2020.

[www.mybioheat.com](http://www.mybioheat.com)

learn more.

Biofuels can also be used for heating. **Bioheat**<sup>®</sup> fuel is a blend of cleaner-burning ultra-low-sulfur heating oil and biodiesel.

## Background/References:

Over 5 million U.S. households use heating oil as a main source of heat. The biodiesel industry has attempted to grow the Bioheat fuel market, a blend of biodiesel and ultra low sulfur heating oil, since 2006.

“It hasn’t been easy,” Paul Nazzaro, supply chain adviser to the National Biodiesel Board, said. “We’ve been through years of studies and testing, years of developing and getting an ASTM standard approved, and faced opposition from some of the equipment manufacturers,” he said.

However, Nazzaro feels the product has potential to make headway with the home heating oil industry, especially in the Northeastern part of the country.

September 2019 the New England Fuel Institute (NEFI) adopted a resolution stating the home heating industry would reduce greenhouse gas emissions based on 1990 levels by 15% by 2023, 40% by 2030, and to net zero emissions by 2050.

<https://www.agri-pulse.com/articles/13125-biodiesel-optimistic-for-bioheat-after-carbon-reduction-pledge>

[Green Energy Consumers](https://blog.greenenergyconsumers.org/blog/start-biodiesel)

<https://blog.greenenergyconsumers.org/blog/start-biodiesel>

Biodiesel is a solvent, which is what makes it burn cleaner than regular heating oil, however in high concentrations it has been known to degrade the rubber seal on fuel pumps for oil burners or furnaces. Of course, a service technician can simply come and replace the seal.

Ethiopia

Haiti

Brazil

Tanzania

*KOKO's "ATM" Dispensers*

Kenya

Copyright 2020 Advanced Biofuels USA

33

*In some parts of the world gathering wood or dung for cooking fires can be dangerous and can cause deforestation. Also, indoor smoke from wood, charcoal and dung fires is very unhealthy. The United Nations and other international organizations support replacing those with cleaner burning stoves such as ethanol stoves.*

### Background/References:

For more information: Project Gaia: <https://projectgaia.com/>  
<https://advancedbiofuelsusa.info/atm-style-machines-used-to-dispense-bioethanol-in-kenya/>

The problem: <https://projectgaia.com/our-approach/the-problem/>  
from indoor air pollution from the dependence on biomass such as charcoal and firewood to the potential dangers faced in gathering solid fuel. Women are the most vulnerable because they disproportionately bear the burden of providing cooking fuel. Fuelwood collection journeys are often arduous, spanning many kilometers and taking hours and leave women vulnerable to injury and assault. Also, deforestation which can be seen over the years particularly around refugee camps.

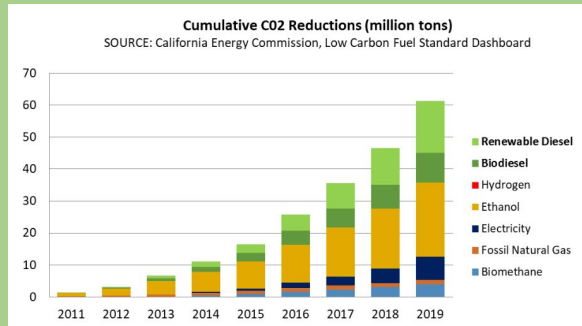

The smoke from wood, charcoal, dung stoves causes illnesses such as heart disease, lung disease, cataracts and 4 million deaths each year.

The solution: <https://projectgaia.com/our-approach/the-solution/>

Clean alcohol fuel stoves (ethanol or methanol) No smoke or soot. No long, dangerous journeys to gather fuel. Possibility of microdistilleries using local agricultural and food/market waste.

and from National Biodiesel Board

<https://www.biofuelsdigest.com/bdigest/2021/01/12/many-reasons-for-u-s-to-count-carbon-savings-from-biodiesel-and-renewable-diesel/>

Copyright 2020 Advanced Biofuels USA

24

*To get an idea of the benefit we see TODAY from renewable fuels, look at California's Low Carbon Fuel Standard and Oregon's Clean Fuel Program results. As you can see, biodiesel, renewable diesel, ethanol and biomethane are generating the greatest reduction in greenhouse gas emissions in the transportation sector. These benefits exceed those from the electrification of cars, trucks and buses by almost 4:1. This demonstrates how today's use of biofuels can provide the greatest amount of carbon footprint reduction in the least amount of time for the lowest price because you can do it with existing vehicles and infrastructure.*

### Background/References:

Making Progress on Climate and Clean Air in a New Administration

<https://www.dieselforum.org/policyinsider/making-progress-on-climate-and-clean-air-in-a-new-administration>

While commercial trucks and buses make up a much smaller share of the vehicles on the road, they are responsible for about 24 percent of GHG emissions from the transportation sector. Within the population of trucks and buses, larger Class 8 trucks are responsible for 60 percent of all emissions, and the largest opportunity.

...

While expectations are high for zero-emission trucks, an overlooked immediate term

strategy to reduce carbon is using advanced biofuels - renewable diesel fuel and biodiesel - in all existing diesel engines. Capable of reducing GHG emissions by at least 50 percent and in the case of renewable diesel fuel over 80 percent, these advanced biofuels are growing in availability and have a proven track record.

Consider that the biggest GHG reductions from the transportation sector in California come from the use of renewable diesel and biodiesel fuel, eliminating more GHG emissions than the switch to electric cars, trucks and buses by almost 4-to-1.

Compared to the investments required for a switch to all-electric vehicles or other alternative fuels, the switch to biodiesel and renewable diesel is easy and comes at a low cost, with no need to invest in new trucks, engines or refueling or recharging stations. These fuels may be distributed in existing fuel infrastructure and may be used in existing diesel engines.

Fuels that Work: Ultra-Low Sulfur Diesel and Biodiesel Power the U.S. Economy  
<https://advancedbiofuelsusa.info/fuels-that-work-ultra-low-sulfur-diesel-and-biodiesel-power-the-u-s-economy/>  
<https://www.dieselforum.org/policyinsider/fuels-that-work-ultra-low-sulfur-diesel-and-biodiesel-power-the-u-s-economy>

#### Advanced Biofuels Deliver Big Benefits at Low Cost

Both biodiesel and renewable diesel fuel are considered advanced biofuels by the U.S. Environmental Protection Agency defined as reducing greenhouse gas reductions at least 50 percent. Renewable diesel fuel is capable of reducing greenhouse gas emissions upwards of 80 percent. The use of these fuels are generating large greenhouse gas reduction benefits with least cost compared to other alternatives.

In California, that requires the gradual reduction in the carbon content of transportation fuels sold in the state through the Low Carbon Fuel Standard, biodiesel and renewable diesel fuel are generating the greatest reduction in greenhouse gas emissions in the transportation sector. These benefits exceed those from the electrification of cars, trucks and buses by almost 4:1. A key advantage to the use of renewable biodiesel fuels is that compared to competing alternatives, they do not require the purchase of new vehicles, equipment or engines nor do they require expensive additional investments in refueling or recharging infrastructure. Their benefits can be felt immediately across entire fleets of vehicles, rather than only in newly acquired vehicles dependent on new infrastructure. Biodiesel fuels can be stored, used, pumped and handled virtually the same way as petroleum diesel products.

Orbital Completes First Operational Cargo Mission to International Space Station for NASA--  
Cygnus Cargo Logistics Spacecraft Reenters Earth's Atmosphere Over Pacific Ocean --  
Company's Next CRS Mission to ISS to Take Place in Early May  
(Dulles, VA 19 February 2014) – Orbital Sciences Corporation (NYSE: ORB), one of the world's  
leading space technology companies, today announced the successful completion of the first  
of eight Cygnus™ operational cargo logistics spacecraft missions to the International Space  
Station (ISS) as part of the company's \$1.9 billion Commercial Resupply Services (CRS) contract  
with NASA. **About Antares**

The Antares medium-class launch vehicle represents a major increase in the payload launch  
capability that Orbital can provide to NASA, the U.S. Air Force and commercial customers  
compared to its heritage small-class space launch vehicles such as Pegasus, Taurus and  
Minotaur. The Antares rocket can launch spacecraft weighing up to 14,000 lbs. (6,400 kg.) into  
low-Earth orbit, as well as lighter-weight payloads into higher-energy orbits. Orbital's newest  
launcher has completed three successful missions and is currently on-ramped to both the  
NASA Launch Services-2 and the U.S. Air Force's Orbital/Suborbital Program-3 contracts,  
enabling the two largest U.S. government space launch customers to order Antares for  
“right-size and right-price” launch services for medium-class spacecraft. For more information

on Antares, visit <http://www.orbital.com/SpaceLaunch/Antares/>.

### **About Cygnus**

Orbital developed the Cygnus cargo spacecraft as part of its Commercial Orbital Transportation Services (COTS) joint research and development initiative with NASA. visit [http://www.orbital.com/NewsInfo/Publications/Cygnus\\_fact.pdf](http://www.orbital.com/NewsInfo/Publications/Cygnus_fact.pdf).

### **About Orbital**

Orbital develops and manufactures small- and medium-class rockets and space systems for commercial, military and civil government customers.

# Sustainable, Renewable Fuels Advanced Biofuels

What are they?

What are they used for?

*Yesterday, Today, Tomorrow*

**How are they made?**

Why are they important?

Sustainability

Policy Considerations

*Jobs/Careers Throughout*

Copyright 2020 Advanced Biofuels USA

27

*So, how are these renewable fuels made? That is, how do you store the energy of the sun in plants or other materials and then make it available to move a car, truck, train or plane?*

## What Are Renewable Fuels?

### How are they made?

Feedstock

Logistics

Technology

Copyright 2020 Advanced Biofuels USA

28

*There are three parts to making renewable fuels:*

- feedstock—the stuff that goes into the recipe;*
- logistics—how do you get the feedstock from where it grows or is produced to the biorefinery;*
- and the technology—how do you convert the feedstock into fuels.*

# Agriculture Forestry Aquaculture

The Foundations  
of the Bioeconomy

## Along with Waste Management for the Circular Economy

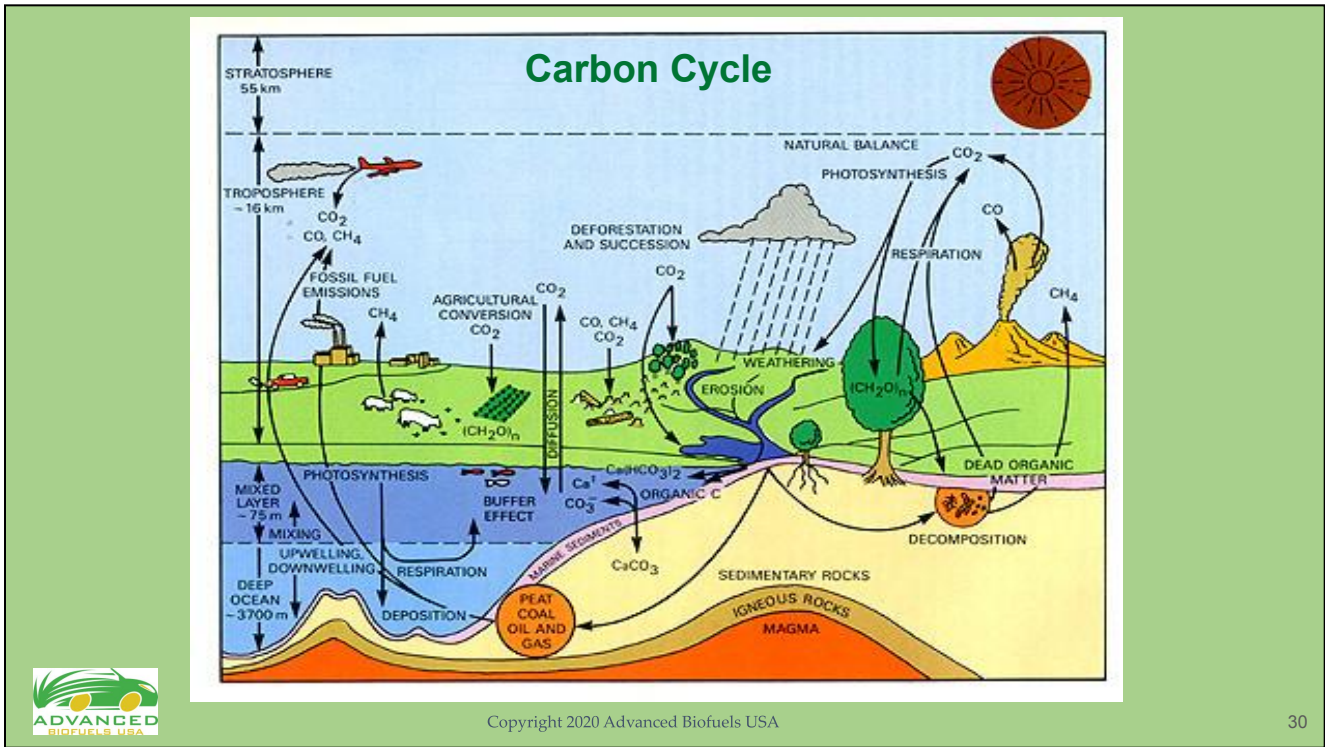

Copyright 2020 Advanced Biofuels USA

29

*If we stop using fossil carbon; stop using petroleum and natural gas to make fuels, plastics, chemicals, all kinds of products; then we will replace those building blocks with products from agriculture, forestry, aquaculture, and waste management. Those will be the foundations of our bio- and circular economies. That way we will recycle and re-use carbon that is already on land and in the air.*

*Thus, Agriculture, Forestry, Aquaculture and Waste Management are the foundations of our future.*

*First, let's look at how we do that with plants. Remember, plants take carbon that is already in the air and use it to grow by a process called photosynthesis. Basically, they recycle carbon and store solar energy. Using fuels made from this recycled carbon reduces the need to take old carbon out of deep storage in the Earth.*

**Background/References:**

**Less pollution**

In addition, fuels like ethanol, biodiesel, renewable diesel, SAF and RNG and renewable heating and shipping fuel burn cleaner, don't put as many pollutants into the air.

In this country, mostly for transportation; but in other countries ethanol and biodiesel can replace wood and dung which put lots of soot into the air which also causes climate change.

Biofuels are carbon neutral, don't contribute to an increase in greenhouse gases related to the carbon they take out of the atmosphere when they are growing. Think of it. Plants that you can see are made out of the air that you can't see.

And recycling the carbon already on land in the form of plastics and industrial flue gases also reduces the carbon that needs to be taken out of deep storage.

*Ready to Harvest, Danville,  
VA*

Copyright 2020 Advanced Biofuels USA

54

*Energy tobacco is being tested in Virginia as a way to use swine manure for fertilizer in a safe and sustainable way.*

### **Background/References:**

Smithfield Foods' Hog Production Division, Murphy-Brown, LLC, and Tyton BioEnergy Systems announced a research partnership to develop new applications for Tyton's dedicated, non-smoking tobacco crop and the resulting soil amendment, filtration, and feed products within Smithfield's hog production processes. The companies are pursuing mutual goals of protecting the environment while improving economic efficiency through this collaboration.

The two companies are establishing field trials with non-smoking tobacco using hog manure as fertilizer. High absorption rates of hog-fertilizer by non-smoking tobacco would enhance environmental outcomes and assist Tyton in obtaining lower-cost fertilizer for its industrial crop. In addition, the companies are pursuing the development of ethanol products using tobacco as raw material rather than corn.

Smithfield and Tyton also will develop applications for Tyton's tobacco-based biochar and activated carbon products, which can be used for a wide-range of filtration, land remediation, and soil amendment purposes. Other research activities with Tyton co-products will occur in parallel.

Gregg Schmidt, president of Smithfield's Hog Production Division, said, "This innovative project is a great opportunity for us and we are excited to be collaborating with Tyton

BioEnergy Systems. We are always seeking novel ways to manage hog manure that demonstrate continual improvement, and we are also excited about the opportunity to pursue the development of ethanol options that utilize tobacco as their primary raw material source."

Tyton BioEnergy Systems president Peter Majeranowski remarked, "Through our partnership in Virginia and North Carolina, Tyton and Smithfield can develop new applications for non-smoking tobacco to deliver value to farmers, value to the agriculture industry, and protect the environment. We see it as a responsibility to secure America's food, energy and environmental futures, and we are so pleased to be working with Smithfield who joins us in advancing towards these goals."

<https://www.biofuelsdigest.com/bdigest/2020/12/22/microalgae-for-recycling-water-and-nutrients-the-digests-2020-multi-slide-guide-to-microbio-engineering/16/>

## Examples of potential crops/plants which can be used for production of biofuels—wastes/residues

AGRICULTURAL RESIDUES

Corn Stover, Corn Cobs

*After corn kernels are harvested, what's left is stalks, leaves and cobs that could also be used to make biofuels. Most US ethanol is made from corn starch sugars; many biorefineries are also using the fibers from the kernel and sending the leftover corn oil to biodiesel refineries. The high protein remains are a valuable animal feed.*

### **Background/References:**

## Examples of potential crops/plants which can be used for production of biofuels—wastes/residues

Woody Biomass

Forest Waste and Residues

49

*Much is being done with Woody Biomass, and Forest Waste and Residues especially in the Northwest US and upper New York state and in Finland and other Nordic countries with large forest-based industries.*

### **Background/References:**

Sawdust <https://advancedbiofuelsusa.info/tag/sawdust/>

Wood chips might be left-overs or residues of other forest products processes. For example from sawmills. Or from slash and waste at forest harvest sites—materials that would otherwise be burned in the open. But then you have a logistics issue—getting the waste wood from the forest to the biorefinery for an economical price.

You might also have purpose-grown wood, just as you have for some pulp/paper mills; especially when those have gone out of business.

*Woody Biomass*

*Forest Waste and Residues*

Tamil Nadu to Have World’s First Biorefinery Using Tannery Waste  
Submitted by [admin](#) on June 26, 2012 – 7:00 pm [No Comment](#) by Kumar Chellappan  
(Daily News and Analysis India) Tamil Nadu will be home to the world’s first biorefinery which will use solid waste generated from tanneries in Vellore district.

The Central Leather Research Institute (CLRI) at Chennai, a unit of the Council for Scientific and Industrial Research (CSIR) has succeeded in developing a biorefinery which will produce biodiesel, bioethanol, biohydrogen and biomethane.

“With this bio refinery we will ensure that tanneries across the country do not discharge any kind of solid waste. There will not be any waste to be discharged because we will use it as raw materials,” Palani Shanmugam (42), the CLRI scientist who designed the refinery told *DNA*. [READ MORE](#)

Giving off harmful gases into the atmosphere. Turning the sludge into a renewable fuel is a safer and healthier alternative.

## Examples of potential feedstock which can be used for production of renewable fuels

Biomass for Renewable Hydrogen

Power to Fuel / PtX (E-Fuels or Electrofuels)

Water for Renewable Hydrogen

Renewable Hydrogen plus Carbon Dioxide to Methanol

Copyright 2020 Advanced Biofuels USA

74

*Other examples of renewable fuels not made from plants: Renewable hydrogen from electrolysis of water could replace the fossil hydrogen in the recipe for renewable diesel and jetfuel, or could be mixed with carbon dioxide to make methanol. Both of these can be used as fuel on their own or as building blocks to make other fuels and products.*

### Background/References:

“Power to X” stands for “power to liquid” or “power to gas.” First thought of as a way to store excess solar and wind power so it wasn’t lost, the electricity was used to split water into hydrogen and oxygen, with hydrogen available for later use in fuel cells for transportation as we talked about before or for electricity production. Now, the idea has expanded.

### Water and Carbon Dioxide with Renewable Energy

Advanced fuels, produced with hydrogen that is obtained from the electrolysis of water. The term electrofuels is referring to the process rather than the fuels itself. These are similar or identically to the ones produced with different processes. The terms for the conversion processes of electricity and variable renewable energies (e.g. solar or wind power), to produce electrofuels, are: Power-to-X (PtX), Power-to-Gas (PtG) and Power-to-Liquid (PtL).

<https://advancedbiofuelsusa.info/tag/hydrogen-renewable-hydrogen/>

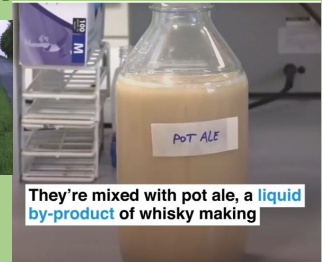

<https://advancedbiofuelsusa.info/category/feedstocks/water/>

process to produce hydrogen as part of a waste management system. The company explains, “It is a self-sustainable thermal conversion treatment of organic waste, including plastics, which breaks down the waste matter and extracts the hydrogen they contain. Since it is not incineration, our process does not create or emit hazardous chemical and, unlike conventional gasification solutions, it produces no tar. This process was engineered, refined and enhanced over more than 15 years in Japan by Japan Blue Energy Co., Ltd.” <https://ways2h.com/solutions/>  
<https://advancedbiofuelsusa.info/?s=Ways2H>

## Not Just Renewable Fuels -- Co-Products!

- Animal Feed
- Agricultural and Forest Residues
- Agricultural Co-Products
- Food Processing Co-Products
- Animal Manure/Waste (dairy cows, swine, poultry)
- Brewery/Vineyard/Whisky
- Biochar, Fertilizer
- Carbon dioxide for dry ice, beverages and medical uses

Celtic Renewables

Copyright 2020 Advanced Biofuels USA

Raisinor/U.C.V.A Distillery

57

*You might have noticed that the renewable feedstocks we have talked about are not just grown for fuel alone. Many are grown for other purposes and the leftovers or co-products are used to make fuel. Also, fuels made from plant-based materials have co-products such as dry ice, animal feed, fertilizer or other healthy soil amendments.*

## A Few Types of Jobs Available in Renewable Fuels Feedstock Development and Production

- Agronomists
- Farmers
- Farm workers
- Farm equipment designers
- Biologists
- Biologists specializing in genetic research
- Biologists specializing in plant cells
- Chemists
- Agricultural Inspectors
- Computer Software Engineers
- Commodity Traders
- Chemical engineers
- Researchers into bioenergy crop development
- Agriculture/horticulture experts
- Freight railroad operators, engineers, loaders, unloaders
- Equipment operators, technicians
- Farm product sales/traders
- Agricultural and Forestry Supervisors
- Agriculture Economists

*And a list of the kinds of jobs involved with the feedstock part of renewable fuels.*

## What Are Renewable Fuels?

### How are they made?

Feedstock

Logistics

Technology

*Now let's take a quick look at logistics—how do you get the feedstock from where it grows or is produced to the biorefinery.*

# Logistics: Harvest, Storage, Transport

## Single-Pass Combination Harvester

AGCO Corporation's single-pass combination harvester saves time and money on corn stover collection by simultaneously harvesting grain and baling corn stover residues in one operation.

## Self-Propelled Bale Picking Truck

Instead of picking up corn stover bales one by one, FDC Enterprises' bale picking truck picks up two at a time for a full load of 36 bales instead of 12 and can transfer them straight onto a truck bed.

Copyright 2020 Advanced Biofuels USA

61

*As more research has been done, practical problems became apparent. For example, unwanted rocks and dirt got harvested along with agricultural residues that used to be left on the field or burned on the field. Engineers and farmers got together to figure out better ways to harvest this new product.*

## Background/References:

<http://www.energy.gov/eere/articles/five-harvesting-technologies-are-making-biofuels-more-competitive-marketplace>

# Logistics: Harvest, Storage, Transport

**INNOVATION**  
**TRANSPORT CHOPPED**

Transport in Bales  
**CONVENTIONAL**

**FEEDSTOCK**  
**SWITCHGRASS**

**Switchgrass Harvesting, Transport, and Storage System**

TeriEne found that chopping switchgrass on the field and transporting it in bulk is actually cheaper than baling it and moving it in bales—although costs for storage are higher, chopping switchgrass on the field is much cheaper than grinding bales at the biorefinery.

**INNOVATION**  
**HARVESTING SYSTEM**

Tractor-Mounted Machinery  
**CONVENTIONAL**

**FEEDSTOCK**  
**SHRUB WILLOW & HYBRID POPLAR TREES**

**Forage Harvester with Optimized Woody Crop**

The State University of New York's project adapted existing forage harvesting machinery to harvest taller and taller crops with greater efficiency and higher-quality wood chips than alternatives such as tractor-mounted machinery.

Copyright 2020 Advanced Biofuels USA

62

*Similarly, the new product needed to be stored without spoiling or bursting into flames. And it had to be chopped to the proper size.*

## Background/References:

<http://www.energy.gov/eere/articles/five-harvesting-technologies-are-making-biofuels-more-competitive-marketplace>

Harvesting: <https://advancedbiofuelsusa.info/tag/harvesting/>

## Logistics: Harvest, Storage, Transport

63

*The feedstock and the finished renewable fuel have to be transported to their destinations by appropriate rail, truck and pipelines. Some adjustments were needed in these areas, too.*

### **Background/Resources:**

Terminals, transport:

<https://advancedbiofuelsusa.info/category/infrastructure/infrastructure-terminals-transport/>

## Logistics: Harvest, Storage, Transport

### Storage of co-product, carbon dioxide (CO<sub>2</sub>), for carbon sequestration

## What Are Renewable Fuels?

### How are they made?

Feedstock

Logistics

Technology

Copyright 2020 Advanced Biofuels USA

65

*A much more difficult challenge, converting the feedstock into fuels, required new technologies--or old technologies used in new ways.*

## Processes

### Biochemical

- Fermentation
- Transesterification
- Enzymatic Hydrolysis
- Enzymatic Catalysis
- Photosynthesis

### Thermochemical/Catalysis

- Gasification
- Plasma arc gasification
- Pyrolysis
- Thermochemical conversion of sugars
- Electrolysis
- Hydrothermal Liquefaction (HTL)

Copyright 2020 Advanced Biofuels USA

85

*These are names of some of the processes that take the feedstock and make it into renewable fuels or the building blocks for fuels and co-products.*

*I usually think of these as fitting into two general categories--seductive and bullying*

*The seductive technologies take place at pretty much ordinary temperatures and pressures and encourage feedstock to convert faster than they might otherwise do--and in a particular desired direction. For example, making things "rot" or break down under controlled conditions by fermentation or enzyme use. Or making them grow with photosynthesis.*

*On the other side, high temperatures and pressures are used to force feedstock to convert.*

*Both of these approaches are needed, depending on the feedstock. For example, HTL is useful to convert wet biomass such as food waste and sewage sludge. Gasification and pyrolysis are good for feedstock high in lignin which is hard to convert by enzymes or yeast. Think of woody biomass, agricultural wastes like straw or nut shells or municipal solid waste.*

Explain enzymes—like the saliva in your mouth.

## Making Plant Biomass Available for Biofuel Production Overcoming Biomass Recalcitrance

Discover enzymes that will “deconstruct”  
cell wall matrices

Examples: Leaf Cutter Ants, Termites,  
Horse or Panda Feces.

Difficulty: Lignin

Copyright 2020 Advanced Biofuels USA

87

*There’s a reason we talk about agricultural and forest waste and residues--because they were the stuff that’s not easy to make useful except for burning or bedding. Often that part of a plant has a lot of lignin--the stuff that makes trees and grasses stand tall. It is very hard to break down. This is known as “biomass recalcitrance.” Think of a two year old who resists going to bed at bedtime.*

*So, we look for clues in nature. What animals eat wood? Maybe those enzymes can be made to work for humans, too.*

### **Background/References:**

When we start with a plant-based feedstock, some parts convert easily. We have been doing that for thousands of years making wine and beer using fermentation and extracting oils for lubrication and cooking.

[https://www.glbrc.org/news/gina-lewin-explores-how-ants-break-down-cellulose?utm\\_source=Spring+Education+%26+Outreach+Newsletter+2015&utm\\_campaign=Feb-2015-GLBRC-E-O-Newsletter&utm\\_medium=email](https://www.glbrc.org/news/gina-lewin-explores-how-ants-break-down-cellulose?utm_source=Spring+Education+%26+Outreach+Newsletter+2015&utm_campaign=Feb-2015-GLBRC-E-O-Newsletter&utm_medium=email) leaf cutter ants at Great Lakes Bioenergy Research Center

<http://www.sciencedaily.com/releases/2013/04/130411194641.htm>

Scientists have described the discovery of a potential treasure-trove of candidate enzymes in fungi thriving in the feces and intestinal tracts of horses. They reported on these enzymes -- the key to economical production of biofuels from non-food plant material -- at the 245th National Meeting & Exposition of the American

Chemical Society (ACS) currently going on in New Orleans.

Michelle A. O'Malley, Ph.D., explained that cellulose is the raw material for making biofuels from non-food plant materials. Cellulose, however, is sealed away inside a tough network of lignin within the cell walls of plants. To produce biofuels from these materials, lignin must be removed through an expensive pretreatment process. Then, a collection of enzymes breaks cellulose down into sugars. Finally, in a process much like production of beer or wine, those sugars become food for microbes to ferment into alcohol for fuel, ingredients for plastics and other materials.

So, what are we trying to do with that feedstock? Often, the first step is to convert feedstock into the building blocks of renewable fuels, such as sugars and oils that then go through other processes to make the finished product.

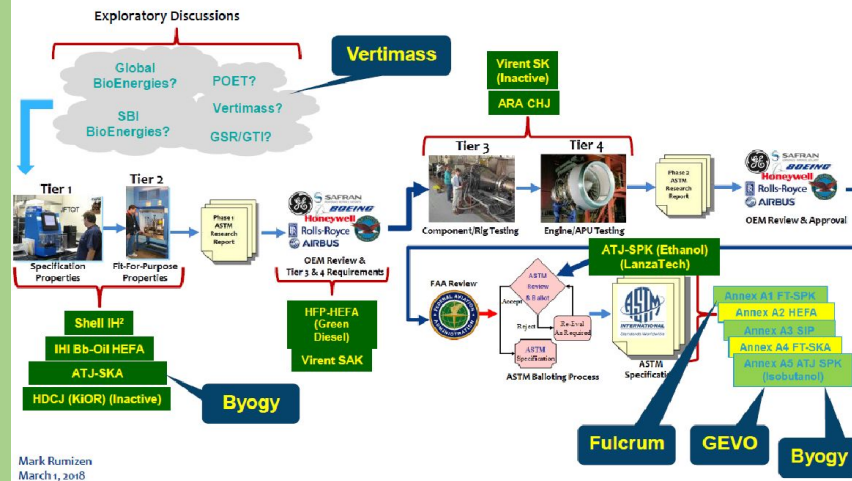

It's relatively easy to unlock the solar power stored in plants to make first generation biofuels like ethanol out of sugars in corn or sugarcane and biodiesel out of soybean oil or used cooking oil.

Panda poo

# ASTM D4054 Qualification Status

## Path To BioJetfuel

89

After the feedstock is converted to building blocks, other processes are used to make the fuels. Here are some examples of conversion processes or pathways used to make renewable jetfuel.

This shows the steps that renewable aviation fuels have to go through to get approved by the international standards organization, ASTM, to assure that they can work as good as or better than petroleum jetfuel in aircraft engines. You can see the names of some of the fuels, the companies working on them and where they were on the path to approval in 2018.

*We also mentioned water and carbon dioxide as feedstocks. Here's a diagram that describes that process and a list of the kinds of fuels that can be made from them, depending on what catalysts are used.*

## Background/References:

The hydrogen produced by electrolysis (breaking water into hydrogen and oxygen with electricity) is either used alone or combined with carbon, to form gaseous or liquid hydrocarbons through synthesis processes. Depending on the desired product, these use different catalysts to produce either methane, methanol, jetfuel, renewable diesel, etc.

The sustainability and GHG emission reduction potential of electrofuels is determined by the origin of electricity and carbon. Using renewable electricity and bio-based carbon increases the sustainability.

Following, a list of different carbon sources:

Electrofuels from non-biogenic origin: CO<sub>2</sub>, which would have been emitted through e.g. fossil fuel burning, is captured and re-used.

Biomass based electrofuels: CO<sub>2</sub> from biomass processing such as fermentation, anaerobic digestion, gasification, combustion is captured and re-used.

Direct air capture (DAC): CO<sub>2</sub> is directly captured from air and re-used.

<https://www.etipbioenergy.eu/value-chains/conversion-technologies/electrofuels>

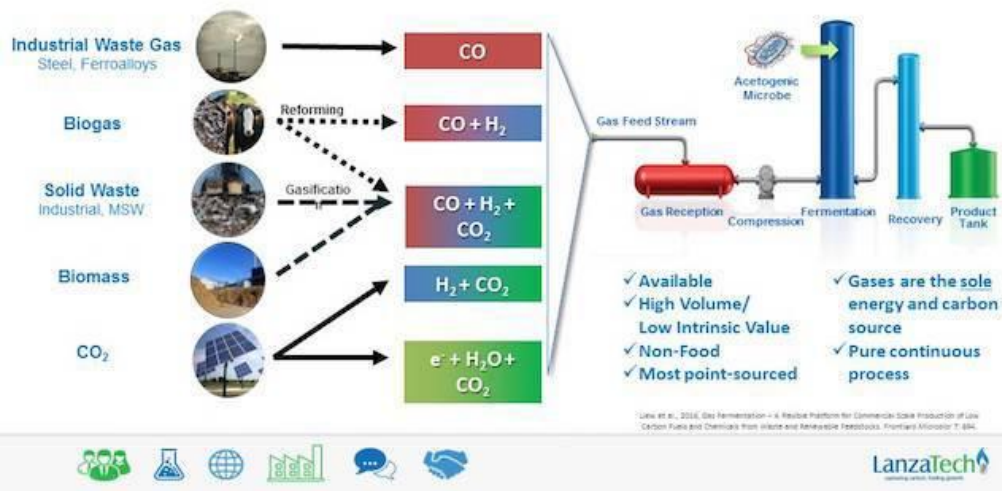

Electro/Renewable H<sub>2</sub> could also be used to replace fossil hydrogen used to make renewable diesel, renewable jetfuel, etc.

## “Green” Ammonia for Maritime Fuel

Yara International is building a pilot facility to make renewable ammonia fuel for maritime use.

Copyright 2020 Advanced Biofuels USA

96

*Yara has started a pilot plant for making renewable ammonia fuel for maritime use by combining nitrogen which has been obtained from air, with renewable hydrogen.*

### Background/References:

What Is The Haber Process | Reactions | Chemistry | FuseSchool

[https://www.youtube.com/watch?v=NWhZ77Qm5y4&ab\\_channel=FuseSchool-GlobalEducation](https://www.youtube.com/watch?v=NWhZ77Qm5y4&ab_channel=FuseSchool-GlobalEducation)

Yara is taking a first step toward greening that process with a pilot plant, set to open in 2019, that will sit next to the existing Pilbara factory. Instead of relying on natural gas to make H<sub>2</sub>, the new add-on will feed power from a 2.5-megawatt solar array into a bank of electrolyzers, which split water into H<sub>2</sub> and O<sub>2</sub>. The facility will still rely on the Haber-Bosch reaction to combine the hydrogen with nitrogen to make ammonia. But the solar-powered hydrogen source cuts total CO<sub>2</sub> emissions from the process roughly in half.

N<sub>2</sub> is easily separated from air, which is 77% nitrogen.

Ammonia <https://advancedbiofuelsusa.info/tag/ammonia/>

<https://www.yara.com/news-and-media/news/archive/2020/green-hydrogen-catapult/>

As Yara observed, “Ammonia’s chemical properties make it ideally suited for the hydrogen economy. It does not require cooling to extreme temperatures, and has a

higher energy density than liquid hydrogen, making it more efficient to transport and store. Ammonia is therefore the most promising hydrogen carrier and zero-carbon shipping fuel.”

**They say: Ammonia is therefore the most promising hydrogen carrier and zero-carbon shipping fuel.** Absolutely, there’s a lot of hydrogen in ammonia compared to other molecules. Ammonia is 18 percent hydrogen by weight, only methane (20 percent) has more hydrogen content among common, stable molecules. By contrast, water is 11 percent hydrogen and typical biomass is around 8 or 9 percent biomass taking in account the water weight.

But, is there a real reason to make ammonia as a transport fuel? Rather, there are plenty of applications in fertilizers, green chemistry and stationary power before we need to turn to solving the problems of hydrogen transport fuels. For example, the world makes roughly 175 million tons of fertilizer, and needs millions more tons of green hydrogen for chemical applications.

In the end, we’re obtaining hydrogen from water and nitrogen from the air, and we’re using green electrons to perform the electrolysis to split the water into oxygen and hydrogen, and the same energy also powers the separation technology to obtain pure nitrogen from the air.

Once you have nitrogen and hydrogen, the Haber-Bosch process is used to produce ammonia.

<https://www.biofuelsdigest.com/bdigest/2020/12/15/yaras-green-ammonia-behemoth-the-500000-tonner-that-will-de-fossilize-agriculture/>

*Chemical & Engineering News:* That massive carbon footprint exists because although the Haber-Bosch process represents a huge technological advancement, it’s always been an energy-hungry one. The reaction, which runs at temperatures around 500 °C and at pressures up to about 20 MPa, sucks up about 1% of the world’s total energy production. It belched up to about 451 million t of CO<sub>2</sub> in 2010, according to the Institute for Industrial Productivity. That total accounts for roughly 1% of global annual CO<sub>2</sub> emissions, more than any other industrial chemical-making reaction....

The carbon footprint of ammonia synthesis goes well beyond its energy demands. Hydrogen used for the reaction comes from natural gas, coal, or oil through processes that release CO<sub>2</sub>. According to a 2013 joint report from the International Energy Agency, the International Council of Chemical Associations, and the Society for Chemical Engineering and Biotechnology, CO<sub>2</sub> emissions from hydrogen production account for more than half of those from the entire ammonia production process. In total, from hydrocarbon feedstocks to NH<sub>3</sub> synthesis, every NH<sub>3</sub> molecule generated releases one molecule of CO<sub>2</sub> as a coproduct.

And our hunger for ammonia fertilizer is increasing. According to the Food and Agriculture Organization of the United Nations, nitrogen fertilizer demand is projected to increase from 110 million t in 2015 to almost 119 million t by 2020.

sustainable. Some are working to power the reaction with renewable energy sources and to generate hydrogen without fossil fuels. Others want to find a more efficient reaction than Haber-Bosch to synthesize ammonia. The researchers admit that progress has been slow but worth it. ## Why replacing fossil fuel is important

**Before oil runs out, it becomes more difficult and dangerous to extract.**

Copyright 2020 Advanced Biofuels USA

104

*Before oil runs out, it becomes more difficult and dangerous to extract. These photos represent “before and after” images of a boreal forest that has been turned into tar sands petroleum production.*

### **Background/References:**

This oil is fossil fuel. It will run out some day. Before it runs out, it becomes very difficult, dangerous and expensive to find and to extract. Remember the oil spill in the Gulf of Mexico in 2010—drilling for oil very, very deep wells

Also the tar sands in Canada

In Canada’s boreal forests, there are almost 3000 square miles of mineable oil sands. Getting to the oil sands means removing the forests. It means that large scale, heavy equipment moves into the landscape, removing the plants, impacting animal populations, and damaging soil, water and air. Shifting Sands documents the work in the oil sands with photos of the oil sands landscapes during and after this process. Some consider this to be a cost of oil production. Others consider this to be an environmental disaster.

"The challenge for producers such as the UAE is to continue producing oil and gas from existing reservoirs while, at the same time, developing new opportunities," he said. "It is no secret that the days of easy oil are coming to an end. Increasingly we are being forced to go down the route of enhanced oil recovery and developing ultra sour oil and gas from complex reservoirs."

These challenges had turned the oil-rich region to become a center for development of new technologies and innovation, Hamli said, referring to the UAE's expansion into renewable energy and its decision to build the zero-carbon Masdar City in Abu Dhabi.

"Our commitment to widening our domestic energy mix and promoting renewable energy does not mean that we have turned our backs to the oil industry," Hamli said.

"Our growing population and fast-moving industrial developments have forced us to choose between continuing burning fossil fuels which would otherwise be exported and finding complementary energy solutions for use at home. We realized that by widening our domestic fuel mix, we could release more hydrocarbons for export," he added.

The UAE has set a target of switching to nuclear power for 25% of its power generation requirements, Hamli said, adding that national peak demand for electricity was set to more than double by 2020 while demand for other forms of energy is growing.

The UAE expects to have its first nuclear power station commissioned in 2017 while at the same time developing solar energy. Abu Dhabi has set a target of generating 7% of its energy needs from renewable sources including solar.

"We believe that the best way of securing a sustainable economic future in a carbon constrained world is to develop a balanced portfolio of clean energy sources in which

nuclear, renewable energy, oil and natural gas all have a role to play," Hamli said.

### Oil Disruption--Geo-Political --1973 Oil Embargo Spurred Development of Home-Grown Fuel

Copyright 2020 Advanced Biofuels USA

81

*There are also geo-political reasons to replace fossil fuel. The oil embargo in the 1970s, showed us the vulnerability of relying of imports for energy. If done right, every country should be able to minimize its reliance on imported energy, increase their energy security and energy independence.*

#### Background/References:

<https://mpt.pbslearningmedia.org/resource/bln12.socst.ush.now.oilcrisis/the-oil-crisis-1979/#.W1TuTkjRU2w>

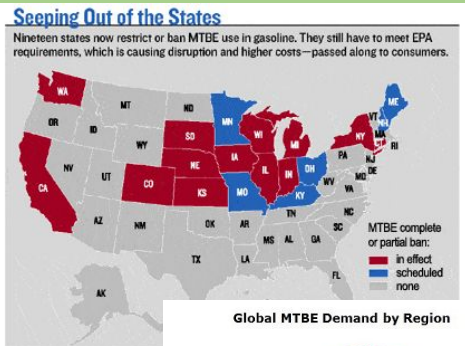

Oil Embargo, 1973–1974. During the 1973 Arab-Israeli War, Arab members of the Organization of Petroleum Exporting Countries (OPEC) imposed an embargo against the United States in retaliation for the U.S. decision to re-supply the Israeli military and to gain leverage in the post-war peace negotiations.

The 1979 (or second) oil crisis or oil shock occurred in the world due to decreased oil output in the wake of the Iranian Revolution. ... The price of crude oil more than doubled to \$39.50 per barrel over the next 12 months, and long lines once again appeared at gas stations, as they had in the 1973 oil crisis.

# Why Replacing Fossil-Fuel Oil Is Important

## Replaces MTBE as an octane enhancer.

Copyright 2020 Advanced Biofuels USA

*Carcinogenic MTBE enters the water supply from leaking underground storage tank systems including those at gas stations. MTBE is highly water soluble, not easily absorbed into soil, and sticks around for a long time. When it was banned in many states, ethanol replaced it.*

### Background/References:

MTBE is highly water soluble, not easily absorbed into soil, and sticks around for a long time.

Thus, with widespread use, MTBE has the potential to occur in high concentrations in groundwater, travel far from leak sources, and accumulate to become a concern for the entire region.

<http://www.cvwd.com/Documents-MTBE-Project.aspx>

<http://www.epa.gov/mtbe/>

MTBE Map- Nathan Vardi Forbes

Methyl Tertiary Butyl Ether (MTBE): 2020 World Market Outlook and Forecast up to 2029

<https://mcgroup.co.uk/researches/methyl-tertiary-butyl-ether-mtbe>

Methyl tertiary butyl ether market trends, developments and prospects:

As methyl tertiary butyl ether (MTBE) has been recognized dangerous to the

environment, USA, Canada, Japan and Western Europe countries shift to ETBE, ethanol and other alternatives and close MTBE facilities

On the contrary, Eastern Europe and Asia Pacific countries build new MTBE capacity

Global MTBE market has been flat in the past years; on the one hand, developed countries lowered MTBE consumption, but on the other hand the demand grew in Asia Pacific, Latin America and the Middle East due to increased gasoline consumption and requirements for cleaner fuel in those areas

World methyl tertiary butyl ether production is foreseen to decrease; China will continue to introduce new capacity but operation rates will go down

Overall MTBE demand growth will be low: USA, Canada, Japan and Western Europe markets will keep on decreasing, but Asia Pacific, Latin America and the Middle East MTBE industries will post growth

# Why replacing fossil fuel is important

## Ethanol Molecule: High Octane, High Oxygen, EV Engine Fuel

### Unique Properties of the Ethanol Hydrocarbon Molecule

- Ethanol is 114 octane = prevents pre-ignition of fuel and lost power under high compression
  - Higher octane = higher compression engines = better fuel efficiency
  - Replaces benzene and other harmful BTEX aromatic additives in gasoline
- Ethanol is 34% oxygen by weight
  - Cleaner burning gasoline by adding oxygen to engine combustion
  - Significantly reduces air pollution
- Ethanol fuel cell generator powers electric motors for pickups, vans and trucks
  - 100% renewable fuel for electric vehicles (50 mpg at 1/3 cost of hydrogen)

# Why Replacing Fossil-Fuel Is Important

## Peak Oil

Copyright 2020 Advanced Biofuels USA

113

*When the oil is gone, the well does not produce more. Or, the economics of extracting the oil mean that it stays in the ground.*

### Background/References:

This is a diagram of how production of oil has peaked in the US, while our need for petroleum fuels has increased, so we have to import oil that we can't produce ourselves. This same dynamic of oil fields being used up is going on around the world. They don't replenish, are not renewable. When the oil is gone, the well doesn't grow more.

What Ever Happened To Peak Oil? Forbes (2018)

<https://www.forbes.com/sites/michaelynch/2018/06/29/what-ever-happened-to-peak-oil/?sh=3ab3e91b731a>

Peak Oil Is Suddenly Upon Us - Bloomberg (2020)

Now "peak oil" refers to peak in demand for petroleum, not peak supply.

<https://www.bloomberg.com/graphics/2020-peak-oil-era-is-suddenly-upon-us/>

Peak Oil

By WILL KENTON Updated Feb 12, 2020

[https://www.investopedia.com/terms/p/peak\\_oil.asp](https://www.investopedia.com/terms/p/peak_oil.asp)

What Is Peak Oil?

Peak oil refers to the hypothetical point at which global crude oil production will hit its maximum rate, after which production will start to decline. This concept is derived from geophysicist Marion King Hubbert's "peak theory," which states that oil production

follows a bell-shaped curve.

In the traditional vision of peak oil, the production decline accelerates as the challenge of extracting new reserves grows. This would put pressure on existing reserves that are drawing down overtime. If new reserves are not brought on line more rapidly than the existing reserves drawdown, then peak oil has been reached. Peak oil has been declared several times, but each deceleration has proved premature because of new extraction technologies like hydraulic fracturing and better surveying revealing previously undiscovered reserves.

### Peak Oil Supply and Demand

Because oil is a non-replenishing resource, there is a limit to how much the world can extract and refine. However, the scenario of total depletion is just one version of peak oil. In theory, peak oil can be brought on by the production squeeze—the drawdown as adding new reserves gets more challenging—but it can also be caused by a production decline when oil alternatives become more cost-effective, pricing oil out of the market, and making exploration and production unprofitable.

# Why replacing fossil fuel is important

Copyright 2020 Advanced Biofuels USA

85

*Renewable fuels recycle the carbon that is already on land and in the air. We won't have to take fossil carbon out of deep storage and add it to the atmosphere.*

## Background/References:

Burning hydrocarbons that used to be buried deep in the Earth releases carbon dioxide into the air. More than we need to grow plants and to sustain life. So it stays for a very long time in the atmosphere causing climate change.

## Less pollution

In addition, fuels like ethanol, biodiesel, renewable diesel, SAF and RNG and renewable heating and shipping fuel burn cleaner, don't put as many pollutants into the air.

Biofuels are carbon neutral, don't contribute to an increase in greenhouse gases related to the carbon they take out of the atmosphere when they are growing. Think of it. Plants that you can see are made out of the air that you can't see.

And recycling the carbon already on land in the form of plastics and industrial flue gases also reduces the carbon that needs to be taken out of deep storage.

## Why Replacing Fossil Fuel is Important

# Solutions to Problems

- Reduce carbon footprints
- Erosion control
- Waste water treatment
- Remediation of contaminated soil
- Nutrient management
- Carbon sequestration
- Alternative to carcinogens / Air Quality
- Overflowing landfill relief/plastic recycling
- Burning agricultural waste in fields
- Grease (fatbergs) in sewers
- Contaminated black market used cooking oil

Copyright 2020 Advanced Biofuels USA

86

*And there are these and other ancillary benefits along the value chain or supply chain of renewable fuels.*

# Sustainable, Renewable Fuels Advanced Biofuels

What are they?

What are they used for?

*Yesterday, Today, Tomorrow*

How are they made?

Why are they important?

**Sustainability**

Policy Considerations

*Jobs/Careers Throughout*

Copyright 2020 Advanced Biofuels USA

89

*We've already talked a lot about sustainability. Let's spend a couple of minutes more.*

# Principles of Sustainability

**Economic      Environmental      Social**

Copyright 2020 Advanced Biofuels USA

90

*What does “sustainable” mean? Endurance? Lasts for a long time? Or, something you can keep doing over and over without it degrading?*

*People talk about the three-legged stool of sustainability. If any leg is missing, the stool falls over.*

*So, when we talk about sustainability and fuels, we mean that they have to have economic viability over a long term; have to allow or enable the environment to be unharmed or helped; and have to have social acceptance, fit into the fabric of a culture.*

*Let’s look at each briefly.*

## **Background/References:**

Advanced biofuels are the ones that are more sustainable, do less damage to the environment, while still being economical to produce and that meet the demands of the society for social values such as the ones we talked about before—energy security, for example.

**Sustainability** is the capacity to endure. For humans, sustainability is the long-term maintenance of well being, which has environmental, economic, and social dimensions, and encompasses the concept of stewardship, the responsible management of resource use. In ecology, sustainability describes how biological systems remain diverse and productive over time, a necessary precondition for human well-being. Long-lived and healthy wetlands and forests are examples of sustainable biological systems (from Wikipedia)

## Principles of Sustainability

- Economic
  - Everyone in the value chain needs to make a living
  - The operation must be financially stable
  - The price of the product must be competitive in its market

91

*Here are some concepts that might be considered when talking about economic aspects of sustainability.*

*Everyone in the value chain from “seed to wheel” making a living from a financially stable operation because the price of the product is competitive.*

### **Background/References:**

The inflection point

Credit worthy feedstock supplier, 15 year terms US \$50/tonne

Demonstration of technology at scale

Credit worthy offtake partner 10-15 years (tough for airlines, although they say they will buy whatever can be produce and although they seem stable, they don't have good balance sheets from the perspective of financiers)

Parity with \$80 oil, unsubsidized on comparable BTUs

(Jim Lane, Biofuels Digest 11 2006)

# Principles of Sustainability

- Economic Environmental Social

As a biofuel producer or investor, how do you determine:

- What feedstock?
- What conversion technology?
- What location?

Copyright 2020 Advanced Biofuels USA

123

*Here are some questions with regard to the economic leg of the sustainability stool.*

## Background/References:

### Biofuel/Bioprocess Biomass Grower Decision Tool Box

#### Need for the Tool Box

In order to meet expanding national needs for the production of non-food crop biofuels, biomass production will have to be substantially increased without decreasing food or forest product production. In large part, this increase in biomass will have to come from perennial grasses, energy crops, and non-forest product managed stands. Specific programs proposed for increasing bioenergy biomass production include:

Intercropping,  
Prairie Recovery,  
Pastureland Preservation,  
Grass Land Cropping, and  
Forest Harvesting

Since the economic margins of growing biomass for commodity biofuels are thin, it is of prime importance that growers have a reliable source of information on the best species/strains to grow and what their expected yields would be. In most cases, yields

are not only a product of macroclimate conditions, but also of microenvironmental conditions including rain fall, soil conditions, and runoff. Questions that growers need to have answered would include:

What species/strains are suitable for their land?

What is the minimum tonnage/acre needed for profitable cropping?

What is the ratio of yield to nutrient inputs?

What is the minimum acreage needed to be profitable?

### **Tool Box Design**

Answers to these questions could be provided by a grower-oriented decision making tool box. The decision making model would be statistically based and would use a database composed of: in-field production data, USDA and state soil condition data, NOAA climatological information, and demand and price information from biofuel/bioproducts markets and technologies. Information would be presented to the grower using maps and charts. Users would have the ability to enter data for specific parameters and could choose output types. Output options would include graphs depicting ranges and what/if solutions.

### **Objective/Work Program for Phase 1 Funding**

The objective of Phase 1 funding would be to determine the data needs and the programming requirements for the Biomass Grower Decision Tool Box. In order to reduce production and maintenance costs and to maximize existing resources, the starting point for this project could be the knowledge base already existing in University of Minnesota, College of Food, Agricultural and National Resources FINBIN Farm Financial Database. On the successful completion of a Phase 1 design study, a pilot program would be developed and tested on a state or regional basis. Once that has been accomplished the program would expand to a national scope.

# Principles of Sustainability

- Economic Environmental Social

## Carbon Cycle/Climate Change

- Reduce use of fertilizer
- Reduce use of water

## Use of renewable energy

- Climate Smart Agriculture
- to help sequester carbon

Copyright 2020 Advanced Biofuels USA

93

*When thinking of the Environmental aspects and climate change, we aspire to carbon neutrality; that the fuel production and use does not contribute to an increase in greenhouse gases. And, we consider other aspects of environmental sustainability- air and water pollution; energy use; feedstock benefits.*

# Principles of Sustainability

- Economic Environmental Social

- Government
- Land ownership

*Here are some specific social aspects that influence renewable fuels understanding, development and use.*

# Principles of Sustainability

- Economic Environmental Social

Here's a company, GEVO, that combines all three aspects of sustainability in what they call a Net-Zero Project Concept.

*Environmental: They produce energy dense liquid hydrocarbons using renewable energy (photosynthetic, wind, renewable natural gas, biogas) with the potential to achieve net-zero greenhouse gas emissions across the whole lifecycle of the liquid fuel and produce extensive high protein animal feed co-products.*

*Social: The fuel fits the current culture and is for use in traditional engines (cars, planes, trucks, and ships).*

*Economic: Citigroup is investing and GEVO has designed the program to enhance the local economies and provide a range of green job opportunities in rural areas.*

## Background/Resources:

Pat Gruber (CEO, Gevo) at ABLC 2020

<https://video.ibm.com/recorded/128227770>

Gevo Announces Net-Zero Project Concept

<https://advancedbiofuelsusa.info/gevo-announces-net-zero-project-concept/>

Net-Zero Projects for the production of energy dense liquid hydrocarbons using renewable energy and Gevo's proprietary technology. The concept of a Net-Zero Project is to convert renewable energy (photosynthetic, wind, renewable natural gas, biogas)

from a variety of sources into energy dense liquid hydrocarbons, that when burned in traditional engines, have the potential to achieve net-zero greenhouse gas (GHG) emissions across the whole lifecycle of the liquid fuel: from the way carbon is captured from the atmosphere, processed to make liquid fuel products, and including the end use (burning as a fuel for cars, planes, trucks, and ships). Gevo announces that its project currently planned to be constructed at Lake Preston, South Dakota will be the first Net-Zero Project and will be named “Net-Zero 1.” Gevo expects that Net-Zero 1 would have the capability to produce liquid hydrocarbons that when burned have a “net-zero” greenhouse gas footprint.

Net-Zero 1 is currently expected to have a capacity of 45MGPY of hydrocarbons (for gasoline and jet fuel, based on current take-or-pay contracts), to produce more than 350,000,000 pounds per year of high protein feed products for use in the food chain, to produce enough renewable natural gas to be self-sufficient for the production process needs, and also to generate renewable electricity with a combined heat and power system. Net-Zero 1 is also expected to utilize wind energy.

Because of the low-carbon footprint feedstocks, the sustainable agricultural practices used to produce feedstock, and the use of renewable energy for the production processes, much of which is expected to be generated on-site, the hydrocarbon fuel products produced at Net-Zero 1 have the potential to achieve net-zero greenhouse gas emissions as measured across the whole of the lifecycle based on Argonne National Laboratory’s GREET model, the pre-eminent science-based lifecycle analysis model. The GREET model takes into account emissions and impacts “cradle to cradle” for renewable resource-based fuels including: inputs and generation of raw materials, agriculture practices, chemicals used in production processes of both feedstocks and products, energy sources used in production and transportation, and end fate of products, which for fuel products is usually burning to release energy.

The capital cost for Net-Zero 1 is projected to be on the order of \$700M including the hydrocarbon production and related renewable energy infrastructure which includes anaerobic digestion to produce biogas to run our plant and generate some electricity on-site. Citigroup is assisting Gevo in raising the necessary capital for Net-Zero 1.

...

Our Net-Zero 1 Project isn’t just about capturing renewable energy and carbon, and transforming it into liquid renewable energy; it’s also about generating enormous quantities of protein, and nutrition for the food chain. The high protein feed would be low-carbon footprint too—and we are happy to help farmers raise beef, pigs, chicken, and dairy in a way that lowers GHG emissions. We’ve got work to do to make it all happen,” said Dr. Patrick R. Gruber, Chief Executive Officer, Gevo.

Gradable, which was launched by Farmers Business Network (FBN) in September 2020, provides new technology and services that facilitate the scoring, sourcing, and pricing of Low-Carbon Grain, making environmental transparency in the grain industry a reality now. Gradable enables comprehensive environmental transparency and supports a market for premium, environmentally-scored grain. Gradable also provides buying intelligence software that directly connects farmers with consumer packaged goods companies, animal feed providers, biofuel makers and the world's other major grain buyers.

<http://www.aemetis.com/aemetis-carbon-zero-solar-energy-and-energy-efficiency-upgrades-supported-by-16-8-million-of-california-cec-and-utility-grants/>

Aemetis "Carbon Zero" Solar Energy and Energy Efficiency Upgrades Supported by \$16.8 million of California CEC and Utility Grants

Aemetis' Carbon Zero production plants commercialize patented technology exclusive to Aemetis for agricultural and forest waste wood feedstock. Carbon Zero plants are integrated with existing Aemetis production facilities to produce energy dense renewable fuels using renewable energy and below zero carbon intensity waste feedstocks.

Carbon Zero production plants are designed to convert below zero carbon feedstocks (waste wood and ag wastes) and renewable energy (solar, renewable natural gas, biogas) into energy dense liquid renewable fuels. Aemetis expects that such renewable fuels, when used in hybrid electric vehicles or other vehicle engines, will have a "below zero carbon" greenhouse gas footprint across the entire lifecycle of the fuel based on the Argonne National Laboratory's GREET model, the pre-eminent science-based lifecycle analysis measurement tool.

# Sustainable, Renewable Fuels Advanced Biofuels

**What are they?**

**What are they used for?**

*Yesterday, Today, Tomorrow*

**How are they made?**

**Why are they important?**

**Sustainability**

**Policy Considerations**

*Jobs/Careers Throughout*

Copyright 2020 Advanced Biofuels USA

97

*We have mentioned policy influence on renewable fuels a few times. The topic is vast and complex. Here are a few items to watch for.*

## Policy Considerations

### Presidential Exhortations to “Get off Our Addiction to Oil” in One Way or a Another

<http://www.cc.com/video-clips/n5dnf3/the-daily-show-with-jon-stewart-an-energy-independent-future>

98

*Some years ago, Jon Stewart on The Daily Show had a long skit that included videos of presidents from Richard Nixon through Barack Obama urging energy security and energy independence. The point was that there has been much talk, but little achievement of that goal.*

### Background/Resources:

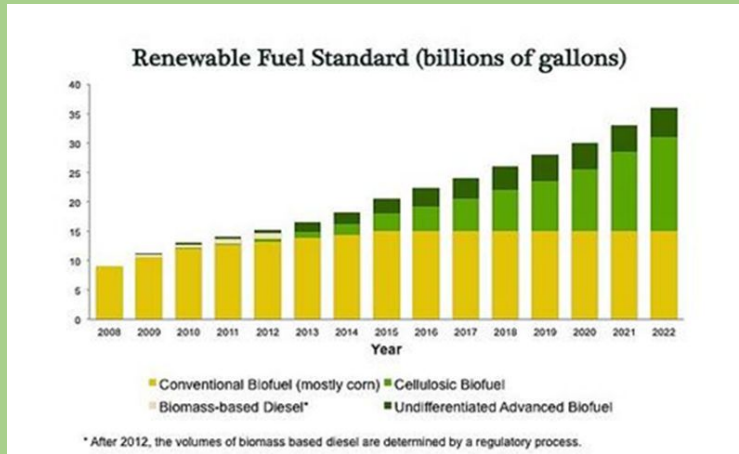

An Energy-Independent Future Video:

<http://www.cc.com/video-clips/n5dnf3/the-daily-show-with-jon-stewart-an-energy-independent-future>

## Policy Considerations

**“Get off Our Addiction to Oil” -- President George W. Bush’s call to action.**

Result was the Renewable Fuel Standard (RFS) in the 2007 Energy Independence and Security Act

Copyright 2020 Advanced Biofuels USA

99

*In 2007, the Renewable Fuel Standard was passed with the intent to wean the US off of petroleum by requiring oil refiners or importers to put into their products specific kinds of renewable fuels in increasing amounts over time. The amounts set for corn ethanol have been met and exceeded. Oil refiners have fought hard against giving up any market share for amounts of ethanol or any other renewable fuels beyond the amounts needed to replace MTBE.*

### **Background/References:**

The amounts were to grow each year, with a limit to the amount of corn ethanol that would be counted toward achieving their goals. Because advanced renewable fuels had not been developed yet, the Environmental Protection Agency could decrease the required amounts based on what they ascertained was available. In 2022, EPA would determine the required volume amounts, calculated with attention to six specific criteria.

Renewable Fuel Standard:

<https://advancedbiofuelsusa.info/tag/renewable-fuel-standard-rfs-and-rfs2/>

## Policy Considerations

### California's Low Carbon Fuel Standard

Similar policy in Oregon and being considered in Washington, New York, Minnesota, New Mexico and some other states

Cumulative CO2 Reductions (million tons)

SOURCE: California Energy Commission, Low Carbon Fuel Standard Dashboard

Graphic from Diesel Technology Forum  
<https://www.dieselforum.org/policyinsider/making-progress-on-climate-and-clean-air-in-a-new-administration>

134

*The other key US policy is California's Low Carbon Fuel Standard which, instead of volume-based is criteria-based and linked to a carbon credit trading scheme. Thus, fuels are credited for the amount of fossil carbon for which they substitute according to strict multi-factor "seed-to-wheel" or "well-to-wheel" calculations called "carbon intensity". Oregon has adopted a version of this and the US Congress and a number of state legislatures are considering it. Canada is in the process of implementing a Clean Fuel Standard.*

# Policy Considerations

## European Union's Renewable Energy Directive

Consumption of biofuels for transport in the European Union (EU-28) from 2015 to 2019, by fuel type (8% from renewable sources)

Copyright 2020 Advanced Biofuels USA

136

The main policy in the European Union is the Renewable Energy Directive II which targets greenhouse gas reduction for all types of energy use, including transportation with targets for renewable transportation fuel at 14% by 2030. The EU is now revising targets as part of its Green Deal.

### Background/References:

Energy for transport: 8% from renewable sources (European Commission)

The share of energy used for transport that comes from renewable sources stood at 8.0% in the European Union (EU) in 2018, compared with 7.1% in 2017, 3.9% in 2008 and 1.4% in 2004, the first year for which data are available.

Compared with 2017, the share of energy from renewable sources used for transport increased in 21 of the 28 Member States in 2018, remained stable in two Member States and decreased in five.

Sweden had by far the highest share - lowest share in Cyprus

Sweden, with 29.7%, had by far the highest share of renewable energy in transport

fuel consumption in 2018, ahead of Finland with 14.1%, the Netherlands 9.6% and Austria 9.8%.

At the opposite end of the scale, the lowest proportion was recorded in Cyprus (2.7%). Low shares (below 4%) were also recorded in Croatia, Greece and Estonia.  
<https://ec.europa.eu/eurostat/web/products-eurostat-news/-/DDN-20200123-2>

### **Biofuels consumption for transport in the European Union (EU-28) 2015-2019**

Published by N. Sönnichsen, Sep 29, 2020

Biofuels consumption for transport in the 28 European Union members continuously rose over the years. Between 2015 and 2019, total biodiesel consumption increased by some 3.62 million metric tons. In 2019, total biofuel consumption reached 17.83 million metric tons, of which roughly 14.35 million metric tons of oil equivalent were biodiesel, making them the most consumed biofuel in Europe.

<https://www.statista.com/statistics/613238/biofuels-consumption-transport-eu/>

As part of the European Green Deal, the Commission proposed in September 2020 to raise the 2030 greenhouse gas emission reduction target, including emissions and removals, to at least 55% compared to 1990.

[https://ec.europa.eu/clima/policies/strategies/2030\\_en](https://ec.europa.eu/clima/policies/strategies/2030_en)

<https://ec.europa.eu/jrc/en/jec/renewable-energy-recast-2030-red-ii>

### **SUSTAINABILITY CRITERIA**

The RED II defines a series of sustainability and GHG emission criteria that bioliquids used in transport must comply with to be counted towards the overall 14% target and to be eligible for financial support by public authorities. Some of these criteria are the same as in the original RED, while others are new or reformulated. In particular, the RED II introduces sustainability for forestry feedstocks as well as GHG criteria for solid and gaseous biomass fuels.

Member States must require fuel suppliers to supply a minimum of 14% of the energy consumed in road and rail transport by 2030 as renewable energy.

“Recycled Carbon Fuels” are now included in this policy.

[http://www.studiogearup.com/wp-content/uploads/2019/10/19\\_0927\\_sGU\\_UPEI\\_Renewable-Fuels-Paper\\_FFV.pdf](http://www.studiogearup.com/wp-content/uploads/2019/10/19_0927_sGU_UPEI_Renewable-Fuels-Paper_FFV.pdf)

Policies that influence sustainable aviation fuel (SAF) development and use are CORSIA and the EU ETS.

The Carbon Offsetting and Reduction Scheme for International Aviation is a carbon offset and carbon reduction scheme to lower CO<sub>2</sub> emissions for international flights, to curb the aviation impact on climate change. Developed by the International Civil

Aviation Organization

CORSIA 101 – A Beginner’s Guide by Stillwater Associates:

European Emissions Trading System. [https://ec.europa.eu/clima/policies/ets\\_en](https://ec.europa.eu/clima/policies/ets_en)

To achieve a climate-neutral EU by 2050 and the intermediate target of an at least 55% net reduction in greenhouse gas emissions by 2030, the Commission is proposing to revise and possibly expand the scope of the EU ETS. The Commission has published an inception impact assessment and launched an open public consultation on the revision of the system. A 'cap and trade' system.

## Policy Considerations

### The Digest's **Biofuels Mandates Around the World 2021**

65 countries have targets or mandates — but how much where, and when, and what?

The bulk of mandates continue to come from the EU-27. 14 countries in the Americas have mandates or targets in place or under consideration, 12 in Asia-Pac, 11 in Africa and the Indian Ocean, and 4 from non-EU countries in Europe.

Besides the EU, the major blending mandates that will drive global demand are those set in the US. India, Brazil with Malaysia and Indonesia becoming major players on the diesel side. — each of which has set targets — or, in the case of Brazil, is already there. Who's Got What, exactly? Here's your up to date guide!

A **DigestConnect** special presentation - September 2020

## Policy Considerations

- Carbon Pricing or Carbon Tax
- Bans on Vehicles
- Eliminating Fossil Fuel Government Subsidies
- Requiring Government Entities to Use Renewable Fuels
- Requiring Disclosure of Climate Change Risks by Publicly Traded Companies
- Production Tax Credits
- Investor Focus on Non-financial Factors (Environment, Social, Governance (ESG))

*What other policies might work? Here are some more ideas being implemented and considered.*

## A Few Types of Jobs in Communicating Importance of Advanced Biofuels

- Public Relations
- Economic Development
- Marketing/Sales
- Elected Official
- Federal Agency Staff
- State Agency Staff
- Advocates
- Lawyers
- Office Administrative Staff
- Book Publishers
- County/Local Administrative Staff
- Journalists
- Writers
- Photographers
- Broadcast Media Professionals
- Teachers
- Teaching Assistants
- Nonprofit Organization Staff
- Event Organizers
- Fundraisers
- Others?

*Jobs that help us better understand and make informed decisions about renewable fuels have a crucial value to all aspects of transitioning from fossil fuel to renewables. Teaching, advocating, funding and more.*
